Community Energy Advice Pilot

Synthetic example document for Gap Finder

This is an original synthetic document created for software testing. It contains no real people, cases, measurements, or external source text.

Pilot overview

A fictional municipality offered energy consultations at three neighborhood centers for twelve weeks. Advisors explained heating controls, insulation options, and ways to compare electricity contracts. Attendance was recorded by session and broad housing type, without collecting names or exact addresses.

Participants most often asked about apartment buildings with shared heating systems. The prepared guidance focused mainly on detached homes, so advisors created temporary notes for recurring questions. These notes were useful during the pilot but were not reviewed as formal guidance.

Observed limitations

The pilot did not measure whether households later changed equipment or reduced energy use. Evening sessions were offered only once, and interpretation was available for two languages. Renters, people with limited mobility, and residents without internet access may therefore be underrepresented in the feedback.

A follow-up study should define outcome measures, compare different appointment formats, and examine who does not use the service. It should also clarify which organization is responsible for updating technical advice when prices, subsidies, or regulations change.
