Coastal Adaptation Workshop Notes

Synthetic planning material

This is an original synthetic document created for software testing. It contains no real people, cases, measurements, or external source text.

Workshop summary

A fictional coastal district compared three adaptation measures: restoring wetlands, raising selected roads, and creating shaded emergency gathering points. Participants scored each measure for maintenance effort, accessibility, ecological impact, and usefulness during compound events. The exercise used invented locations and values so that the document can be shared as a software test fixture.

The group identified missing evidence about winter groundwater levels, the travel needs of residents without cars, and maintenance responsibilities after grant funding ends. No preferred measure was selected. The next workshop will test combinations of measures and document which assumptions drive the ranking.
